This is the amino acid sequence of the human protein SR-p70b. SR-p70 are transcription factors which may control the activity of p53-regulated genes, and are expressed by tumour suppressor genes related to the p53 gene family. The gene sequence was isolated from the human neuroblastoma cell line SK-N-SH, using primers AAV01515 and AAV01518. The SR-p70b gene sequence contains a 94 bp deletion between bases 1516-1517 as compared to the SR-p70a sequence (AAV01498). This deletion causes a reading frame shift resulting in the generation of a stop codon at position 1498-1500. The resultant protein is truncated by 137 amino acids as compared to the SR-p70a protein (AAW36184). The sequence can be used in the diagnosis and monitoring of cancer, especially neuroblastoma. The nucleic acid sequences and corresponding antisense sequences, are also useful in gene therapy, e.g. to regulate apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       142 wtyspllkklycgiak--tcpigikvstppppgtairampvykkaehvtdvvkrcpnhel 199

Apoptosis can be induced in E6-expressing cells, by administering p73 protein or DNA construct encoding p73. It can be used to treat human papilloma virus (HPV) infections, cancers of the uterine cervix, anogenital, oesophageal squamous cell cancer, laryngeal papilloma, and bronchiolo-alveolar, penile and bladder carcinoma.

A method has been developed for treating a subject having a p53-dependent tumour cell. The method comprises: (a) determining the level of NBS-1 protein (also known as p73) expressed in the tumour cell and in a corresponding non-malignant cell; (b) selecting subjects having NBS-1 protein level comparable or below that in a corresponding normal cell; (c) elevating tumour cell NBS-1 level, where NBS-1 interacts with p53-responsive promoters. Also described in the present invention is an antibody that specifically binds to NBS-1, and an antibody raised to the carboxy portion of NBS-1. NBS-1 can activate the transcription of p53-responsive genes and can inhibit cell growth in a p53-like manner. The present sequence represents the human NBS-1 alpha protein from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       142 wtyspllkklycqiak--tcpiqikvstppppgtairampvykkaehvtdvvkrcpnhel 199

                                                                                                                                                                                                                                                                             This is the amino acid sequence of the human protein SR-p70a. SR-p70 are transcription factors which may control the activity of p53-regulated genes, and are expressed by tumour suppressor genes relate to the p53 gene family. The gene sequence was isolated from the human colon adenocarcinoma cell line HT-29, using primers AAV01506-7. The sequence can be used in the diagnosis and monitoring of cancer, especially neuroblastoma. The nucleic acid sequences and corresponding antisense sequences, are also useful in gene therapy, e.g. to regulate

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              variant of p73. p73 is a homolog of p53 tumour suppressor, capable of arresting the growth of E6 protein-expressing cells. It is not targeted for degradation by E6 oncoprotein and has been found to be a potent inhibitor of cancer colony growth and inducer of apoptosis. Apoptosis can be induced in E6-expressing cells, by administering p73 protein or a DNA construct encoding p73. It can be used to treat human papilloma virus (HPV) infections, cancers of the uterine cervix, anogenital, bronchiolo-alveolar, penile and bladder carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              83 spytpehaasvpthspyaqpsstfdtmspapvipsntdyp-gphhfevtfqqsstaksat 141
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ilynfmcnsscvggmnrrpiliiitlemrdgqvlgrrsfegricacpgrdrkadedhyre 311

cells. SR-p70 are transcription factors which may control the activity of p53-regulated genes, and are expressed by tumour suppressor genes related to the p53 gene family. The gene sequence was isolated from a cDNA library by sequencing the inserts and comparing to sequence databases. The protein sequence contains regions of homology to the p53 protein. A second sequence (SR-p70b) was also isolated from the library and was caused by differential splicing of the sequence (see AAV01497). The sequences can be used in the diagnosis and monitoring of cancer, especially neuroblastoma. The nucleic acid sequences and corresponding antisense sequences, are also useful in gene therapy, e.g. to regulate

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               databases. The protein sequence contains regions of homology to the p53 protein. The SR-p70b gene sequence was isolated simultaneously with the SR-p70a sequence (AAV01496) from the library and is created by differential splicing of the SR-p70 mRNA sequence. The sequences can be used in the diagnosis and monitoring of cancer, especially neuroblastoma. The nucleic acid sequences and corresponding antisense sequences, are also useful in gene therapy, e.g. to regulate apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         activity

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This is the amino acid sequence of the protein SR-p70b from monk cells. SR-p70 are transcription factors which may control the acof p53-regulated genes, and are expressed by tumour suppressor grelated to the p53 gene family. The gene sequence was isolated cDNA library by sequencing the inserts and comparing to sequence databases. The protein sequence contains regions of homology to

It has been observed that the intron-exon organisation is conserved between p73 and p53, and from

The p51 gene can be used in the investigation, diagnosis and treatment of diseases such as cancer, with which the p53 family cell proliferation regulation is associated. The p51 protein may be used for screening potential agonists and antagonists of its regulatory function for use as drugs,

```
known exon and intron sizes for these 2 genes, it was possible to identify new members of this gene family using a PCR-based strategy of amplifying 2 exons in a conserved domain and their intervening intron. The human p53 gene was localised to chromosomal position 3427-29. At least 6 different isotypes exist. Splice variants differing at the C-terminus have been designated as alpha, beta and gamma forms, while p63 members differing in the N-terminus are designated as deltan and TA forms, where the deltan form lacks the transactivation domain. The present sequence represents human p63 isotype TAp63 gamma. p63 was detected in a veriety of thuman and mouse tissue. It demonstrates remarkably divergent activities, such as the ability to transactivate p53 reporter genes and induce apoptosis. Cessation or fown-regulation of p63 expression may play a critical role in the process of cervical squamous differentiation, both benign and necelastic Deltan isotopes of p63 act as dominant negatives towards transactivation by p53 and p63. p63 may also be implicated in haematopoiesis, muscle wasting (e.g. cachexia) and neuronal differentiation and related degenerative disorders. p63 polypeptides (see AAX0593-64), polynucleotides (see AAX58972-83) and anti-p63 antibodies of the invention can be used to identify compounds useful for treating disorders involving such processes, in detection and diagnosis, and in the production of transgenic animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 192

```

```
This invention describes a novel isolated polypeptide (I) which comprising an immunogenic portion of a lung tumor protein or variant (P2) which have cytostatic activity. The polypeptides and polynucleotides are used in compositions and vaccines to inhibit the development of cancer, especially lung cancer, in a patient. Methods described in the invention can be used to monitor the progression of a cancer by carrying out the detection at subsequent time points and comparing the results from the different time points. CD4+ and/or CD8+ T-Cells isolated from a patient are treated with P2, polynucleotides encoding P2 or antigen presenting cells expressing P2 and then administered to the patient to inhibit
                                                                                                                                                                                                                                                                                                                                                       cancer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                셤
```

The present invention concerns the discovery of a new family of cell regulatory proteins (CRRs) termed the p63 family of proteins, which demonstrate certain sequence identity to known tunnour suppressor proteins p53 and p73. It has been observed that the intron-exon and intron sizes for these 2 genes, it was possible to intron-exon and intron sizes for these 2 genes, it was possible to identify new members of this gene family using a PCR-based strategy of amplifying 2 exons in a conserved domain and their intervening intron. The human p53 gene was localised to chromosomal position 3427-29. At least 6 different isotypes exist. Splice variants of intron. The human p53 members differing in the N-terminus are designated as deltan and members differing in the N-terminus are designated as deltan and new forms, while p63 members differing in the N-terminus are designated as deltan and nowns, where the deltan form lacks the transactivation domain. The present sequence represents human p63 isotype a TAP63 beta. p63 was detected in a variety of activities, such as the ability to transactivate p53 reporter genes and induce apoptosis. Cessation or down-regulation of p63 expression may play a critical role in the process of cervical squamous differentiation, both benign and neoplastic. Deltan isotopes of p63 may also be implicated in haematopolesis, muscle wasting (e.g. cachexia) and neuronal differentiation and related degenerative of disorders. p63 polypeptides (see AAV56553-64), polynucleotides (see AAX58572-83) and anti-p63 antibodies of the invention can be used to processes, in detection and diagnosis, and in the production of transcent and in derection and diagnosis, and in the processes. e.g. treatment of Cell regulatory protein; p63; huTAp63 beta; TAp63 beta; human; cancer; tumour suppressor; cell cycle control; apoptosis; cell proliferation; cell differentiation; then py. regulatory protein p63, isoform huTAp63 beta New isolated p63 cell regulatory protein for, Claim 23; Fig 10; 161pp; English. 98US-0087216. 97US-0062076. 98WO-US21992 (HARD) HARVARD COLLEGE WPI; 1999-277595/23 N-PSDB; AAX58573. transgenic animals. tunor suppressor protein p53 - Chinese hamster
C;Species: Cricetulus griseus (Chinese hamster)
C;Date: 11-Apr-1997 #sequence_revision 09-May-1997 #text_change 23-Jul-1999
C;Accession: JC6176
R;Lee, H; Larner, J.M.; Hamlin, J.L.
Gene 184, 177-183, 1997
A;Title: Cloning and characterization of Chinese hamster p53 cDNA.
A;Reference number: JC6176; MUID:97183659
A;Contents: liver
A;Reference number: JC6176
A;Molecule type: mRNA
A;Residues: 1-393 <LEE>
A;Contents: liver
A;Residues: 1-393 <LEE>
A;Cross-references: GB:U50395; NID:g1842229; PIDN:AAC53040.1; PID:g1842230
C;Comment: This protein is a multimer, it plays the central role in a complex DNA digenetics:

-!-FUNCTION: ACTS AS A TUMOR SUPPRESSOR IN MANY TUMOR TYPES. INDUCES GROWTH ARREST OR APOPTOSIS DEPENDING ON THE PHYSIOLOGICAL CIRCUMSTANCES OR CELL TYPE, BUT BOTH ACTIVITIES ARE INVOLVED IN TUMOR SUPPRESSION. ACTS IN CELL CYCLE REGULATION, IS A TRANS-ACTIVATOR THAT ACTS TO NEGATIVELY REGULATE CELL DIVISION BY CONTROLLING A SET OF GENES REQUIRED FOR THIS PROCESS. ONE OF THE ACTIVATED GENES IS AN INHIBITOR OF CYCLIN-DEPENDENT KINASES.

APOPTOSIS INDUCTION SEEMS TO BE MEDIATED EITHER BY STIMULATION OF BAX AND FAS ANTIGEN EXPRESSION, OR BY REPRESSION OF BCL-2 EXPRESSION (BY SIMILARITY).

-:- SUBGNITT: BINDS DNA AS AN HOMOTETRAMER (BY SIMILARITY).
     OLIGOMERIZATION.
BASIC (REPRESSION OF DNA-BINDING).
NUCLEAR LOCALIZATION SIGNAL (POTENTIAL).
PHOSPHORYLATION (BY SIMILARITY).

APPEARS NOT TO BE FREQUENTLY MUTATED IN HUMAN CANCERS, IN CONTRAST TO P53. HEMIZYGOSITY IS OBSERVED IN NEUROBLASTOMA AND OLIGODENDROGLIOMA.

SIMILARITY: BELONGS TO THE P53 FAMILY.
                                                                                                                                               GAMMA,
                                                                                                                                                                                                                                                                                                                 SPLEEN, SKELETAL MUSCLE, PROSTATE, THYMUS AND PANCREAS.
INDUCTION: NOT INDUCED BY DNA DAMAGE.
DOMAIN: POSSESES AN ACIDIC TRANSACTIVATION DOMAIN, A CENTRAL DNA BINDING DOMAIN AND A C-TERMINAL OLIGOMERIZATION DOMAIN THAT BINDS TO THE ABL TYROSINE KINASE SH3 DOMAIN.
TYROSINE KINASE SH3 DOMAIN. ISOFORM BETA INTERACTS HOMOTYPICALLY AND WITH P53, WHEREAS ISOFORM ALPHA DOES NOT. ISOFORM GAMMA INTERACTS HOMOTYPICALLY AND WITH ALL P73 ISOFORMS. ISOFORM DELTA INTERACTS WITH ISOFORM GAMMA, ALPHA, AND HOMOTYPICALLY.
SUBCELLULAR LOCATION: NUCLEAR.
ALTERNATIVE PRODUCTS: 7 ISOFORMS; ALPHA (SHOWN HERE), BETA, GAMMA DELTA, EPSILON, ZETA AND KAPPA; ARE PRODUCED BY ALTERNATIVE SPLICING OF EXON 11 IN GAMMA AND EPSILON ISOFORMS RESULTS IN A FRAMESHIFT FROM THE ORIGINAL READING FRAME. THE SPLICING OF EXON 13 IN EPSILON ISOFORM REVERTS THE READING FRAME
                                                                                                                                                                                                                                                                                                     HEART, LIVER,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          TRANSACTIVATION (BY SIMILARITY).
ASP/GLU-RICH (ACIDIC).
NUCLEAR LOCALIZATION SIGNAL (POTENTIAL)
MEDIATES OLIGOMERIZATION (POTENTIAL).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Apoptosis; Nuclear protein; Phosphorylation; Alternative splicing;

                                                                                                                                                                                                                         TYROSINE KINASE SH3 DOMAIN. ISOFORM BETA INTERACTS HOMOTYPICALLY AND WITH P53, WHEREAS ISOFORM ALPHA DOES NOT.
SUBCELLULAR LOCATION: NUCLEAR.
ALTERNATIVE PRODUCTS: 2 ISOFORMS; ALPHA (SHOWN HERE) AND BETA;
ARE PRODUCED BY ALTERNATIVE SPLICING.
DOMAIN: POSSESES AN ACIDIC TRANSACTIVATION DOMAIN, A CENTRAL DNA BINDING DOMAIN AND A C-TERMINAL OLIGOMERIZATION DOMAIN THAT BINDS TO THE ABL TYROSINE KINASE SH3 DOMAIN.
SIMILARITY: BELONGS TO THE P53 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       311

"Sequence analysis of canine p53 in the region of exons 3-8.";

Cancer Lett. 92:181-186(1995).

-!- FUNCTION: ACTS AS A TUMOR SUPPRESSOR IN MANY TUMOR TYPES. INDUCE GROWTH ARREST OR APOPTOSIS DEPENDING ON THE PHYSIOLOGICAL

CIRCUMSTANCES OR CELL TYPE, BUT BOTH ACTIVITIES ARE INVOLVED IN TUMOR SUPPRESSION. ACTS IN CELL CYCLE REGULATION, IS A TRANS-ACTIVATOR THAT ACTS TO NEGATIVELY REGULATE CELL DIVISION BY CONTROLLING A SET OF GENES REQUIRED FOR THIS PROCESS. ONE OF THE ACTIVATED GENES IS AN INHIBITOR OF CYCLIN-DEPENDENT KINASES.

APOPTOSIS INDUCTION SEEMS TO BE MEDIATED EITHER BY STIMULATION OF BAX AND FAS ANTIGEN EXPRESSION, OR BY REPRESSION OF BCL-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ishizaka
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SUBUNIT: BINDS DNA AS AN HOMOTETRAMER (BY SIMILARITY).
SUBCELLULAR LOCATION: NUCLEAR.
DISEASE: P53 IS FOUND IN INCREASED AMOUNTS IN A WIDE VARIETY
OF TRANSFORMED CELLS. P53 IS FREQUENTLY MUTATED OR INACTIVATED
IN MANY TYPES OF CANCER.
                                                                                                                                                                                                                                                                                                                                                               the
